Task 1 – QA Testing

Performed manual exploratory testing on the RealWorld Conduit Demo Application. Tested registration, login, article management, profile settings, and validation flows. Identified and documented five issues with reproduction steps, severity, screenshots, and root cause analysis.

Task 2 – n8n API Integration Workflow

Built an n8n workflow using the GitHub REST API. The workflow retrieves JavaScript repositories, filters the top results, enriches repository data using a second API request, classifies repositories using an IF node (250,000-star threshold), and sends a formatted digest to Telegram. Retry and error-handling mechanisms were implemented for reliability.

Bonus Task – Uptime Monitor

Built a second n8n workflow that monitors the RealWorld Conduit application every 5 minutes. The workflow checks application availability and sends Telegram alerts when the monitored endpoint becomes unavailable. Retry logic was included to handle temporary failures.

Thank you for reviewing my submission.
